Propagating a Harmonic Wave in a Plate with Symmetric Structure

A. V. Melkonyan*, S. V. Sarkisyan

Chair of Mechanics, YSU

In this paper a three-layer plate with symmetrical structure to solve the problem of determining the properties of the middle layer, which can propagate the harmonic wave in three-layer plate with phase speed equal to the phase speed of a single-layer plate.

Keywords: sandwich plate, wave, phase speed.

The research of problems about propagation of waves in plates takes the beginning from works Rayleigh [1] and Lemb [2]. The similar problems are investigated in works [3–5]. In work [6] the problem of propagation of a plane harmonic wave in the reinforced layer is considered.

Consider the three-dimensional problem of propagation of harmonic waves in elastic sandwich plate with symmetrical structure thickness $2H$. On the lanes, limiting plate, given the condition of vanishing normal stress, a shear stress and a tangential displacement. The middle layer of plate concluded between the planes $z = \pm h$.

For the equation of elastic wave propagation in a plate (the Lame equation)

$$c_{a2}^2 \Delta \ddot{u}_a + (c_{a1}^2 - c_{a2}^2) \text{grad div} \dot{u}_a = \ddot{u}_a \quad (1.1)$$

the Lame transformation is introduced

$$\ddot{u}_a = \text{grad} \varphi_a + \text{rot} \psi_a \quad (\text{div} \psi_a = 0) \quad (1.2)$$

Here the following well-known notations are accepted: $c_{a1} = \left(\frac{\lambda_a + 2\mu_a}{\rho_a}\right)^{1/2}$,

$$c_{a2} = \left(\frac{\mu_a}{\rho_a}\right)^{1/2}$$

are respectively the propagation velocities of longitudinal and transverse waves in the material of the layer with number $\alpha$ ($c_{11} = c_{13}$, $c_{12} = c_{33}$), $\alpha$ is the number of layer, $\alpha = 1, 2, 3$, $\ddot{u}_a = u_{a1}\hat{t} + u_{a2}\hat{j} + u_{a3}\hat{k}$ is the displacement vector, $\Delta = \dddot{u}_1^2 + \dddot{u}_2^2 + \dddot{u}_3^2$, $\varphi_a = \frac{\partial}{\partial x}$, $\psi_a = \frac{\partial}{\partial y}$, $\ddot{u}_a = \frac{\partial^2 u_a}{\partial t^2}$, $\varphi_a(x, y, z, t)$, $\psi_a(x, y, z, t)$ are the dynamic potentials, $\lambda_a$ and $\mu_a$ are the Lame coefficients.

* E-mail: av.mlk@inbox.ru
At the substitution of (1.2) in equation (1.1) the following wave equations are obtained

\[ \Delta \varphi_a - c_{a1}^2 \dot{\varphi}_a = 0, \quad \Delta \psi_a - c_{a2}^2 \ddot{\psi}_a = 0. \]  

(1.3)

The general solution of (1.3) is represented as

\[ \varphi_a(x,y,z,t) = \varphi_a^*(z) \cdot \exp(i(k_1x + k_2y - ckt)), \]

\[ \psi_a(x,y,z,t) = \psi_a^*(z) \cdot \exp(i(k_1x + k_2y - ckt)). \]  

(1.4)

Pursuant to (1.4) the equations (1.3) are reduced to ordinary differential equations for unknown functions \( \varphi_a^*(z) \) and \( \psi_a^*(z) \). Solving these equations for dynamic potentials we have

\[ \varphi_a(x,y,z,t) = (A_a \sinh v_{a1} z + B_a \cosh v_{a1} z) \cdot \exp(i(k_1x + k_2y - ckt)), \]

\[ \psi_a(x,y,z,t) = (\tilde{C}_a \sinh v_{a2} z + \tilde{D}_a \cosh v_{a2} z) \cdot \exp(i(k_1x + k_2y - ckt)), \]  

(1.5)

where \( v_{a1}^2 = k_1^2(1 - \eta_a \theta_a), \quad v_{a2}^2 = k_2^2(1 - \eta_a), \quad \eta_a = \frac{c_{a2}^2}{c_{a1}^2}, \quad \theta_a = \frac{c_{a1}^2}{c_{a2}^2}, \quad \gamma = \frac{c_{a2}}{c_{a1}}, \)

c is the propagation velocity of the harmonic wave, \( A_a, B_a, \tilde{C}_a, (C_{a1}, C_{a2}, C_{a3}) \), \( \tilde{D}_a (D_{a1}, D_{a2}, D_{a3}) \) are unknown constants.

According to the transformation (1.2) and the Hooke law the displacements and stress components are expressed in terms of the dynamic potential by means of the following formulas:

\[ u_1 = \tilde{c}_1 \varphi - \tilde{c}_2 \psi_3 - \tilde{c}_3 \psi_2, \quad u_2 = \tilde{c}_2 \varphi - \tilde{c}_3 \psi_1 - \tilde{c}_1 \psi_3, \quad u_3 = \tilde{c}_3 \varphi - \tilde{c}_1 \psi_2 - \tilde{c}_2 \psi_1, \]

\[ \sigma_{11} = 2\mu(c_1^2 \varphi + \tilde{c}_1 \psi_3 + \tilde{c}_2 \psi_2) + \lambda \Delta \varphi, \]

\[ \sigma_{22} = 2\mu(c_2^2 \varphi + \tilde{c}_2 \psi_1 + \tilde{c}_3 \psi_2) + \lambda \Delta \varphi, \]

\[ \sigma_{33} = 2\mu(c_3^2 \varphi + \tilde{c}_3 \psi_1 + \tilde{c}_1 \psi_3) + \lambda \Delta \varphi, \]

\[ \sigma_{12} = \mu(2\tilde{c}_1 \tilde{c}_2 \varphi + \tilde{c}_1 \tilde{c}_3 \psi_1 + \tilde{c}_2 \tilde{c}_3 \varphi_2) + \tilde{c}_1^2 \psi_3 - \tilde{c}_2^2 \psi_2, \]

\[ \sigma_{13} = \mu(2\tilde{c}_1 \tilde{c}_3 \varphi + \tilde{c}_2 \tilde{c}_3 \psi_1 - \tilde{c}_1 \tilde{c}_2 \psi_1 + \tilde{c}_2 \psi_2) + \theta_a \psi_2 - \tilde{c}_2 \psi_1, \]

\[ \sigma_{23} = \mu(2\tilde{c}_2 \tilde{c}_3 \varphi + \tilde{c}_1 \tilde{c}_3 \psi_1 - \tilde{c}_1 \tilde{c}_2 \psi_1 - \tilde{c}_2 \psi_3) + \gamma \psi_3 - \tilde{c}_3 \psi_1. \]  

(1.6)

For determination of constants \( A_a, B_a, \tilde{C}_a \) and \( \tilde{D}_a \) one should use the boundary conditions and the conjugation conditions on the planes \( z = \pm h \). Assuming that on the interfacial planes \( z = \pm H \) the boundary conditions are specified

\[ \sigma_{13} = 0, \quad \sigma_{33} = 0, \quad u_3 = 0. \]  

(1.7)

The conjugation conditions in case of \( z = \pm h \) take the form

\[ \tilde{u}_1 = \tilde{u}_3, \quad \sigma^{(1)}_{12} = \sigma^{(1)}_{23}, \quad \sigma^{(1)}_{21} = \sigma^{(1)}_{32}, \quad \sigma^{(1)}_{31} = \sigma^{(1)}_{23}. \]  

(1.8)

Substituting (1.5) in equations (1.6) and using the boundary condition (1.7) and (1.8), we obtain a system of eighteen linear homogeneous equations with constants \( A_a, B_a, \tilde{C}_a \) and \( \tilde{D}_a \). The characteristic equation for determination of harmonic wave velocity in a three-layer plate is obtained by equating the determinant of this system to zero. Below we consider two versions that are related to solving the problem of periodic wave propagation in an elastic layer [6].
2. Consider a partial solution for the first layer

\[ \psi_{11} = D_1 \cosh(v_{11} z) \exp \left( k_1 (x + k_2 y - c t) \right) \]

and for the second layer

\[ \psi_{21} = C_1 \sinh(v_{21} z) \exp \left( k_1 (x + k_2 y - c t) \right) \]

(2.1)

and

\[ \psi_{12} = D_2 \cosh(v_{12} z) \exp \left( k_1 (x + k_2 y - c t) \right) \]

\[ \psi_{22} = C_2 \sinh(v_{22} z) \exp \left( k_1 (x + k_2 y - c t) \right) \]

(2.2)

Solution (2.1) for the first layer corresponds to the antisymmetric form vibrations, and (2.2) for the second layer corresponds to the symmetrical form vibrations.

Keeping in mind that \( \nabla \cdot \psi_1 = 0 \) and \( \nabla \cdot \psi_2 = 0 \), we obtain after substitution of (2.1) and (2.2) in equations (1.6) and are regard for boundary conditions (1.7) and (1.8)

\[ \psi_{11} = \psi_{12} = \psi_{21} = \psi_{22} = 0 \]

(2.3)

For existence of nonzero solutions of (2.3) and (2.4) it is required that their determinants be zero. From this condition we obtain the following dispersion equation:

\[ (\lambda + 2 \mu v_{11}^2 - \lambda k^2) \psi_{11} - 2ik_1 \mu v_{11} \psi_{12} H \cdot D_{11} + 2ik_2 \mu v_{11} \psi_{12} H \cdot D_{12} = 0 \]

\[ ik_1 \psi_{11} - ik_1 \psi_{12} C_{11} + ik_2 \psi_{21} H \cdot D_{12} = 0 \]

(2.5)

For existence of nonzero solutions of (2.3) and (2.4) it is required that their determinants be zero. From this condition we obtain the following dispersion equation:

\[ \psi_{11} = \psi_{12} = \psi_{21} = \psi_{22} = 0 \]

(2.3)

\[ \psi_{11} = \psi_{12} = \psi_{21} = \psi_{22} = 0 \]

(2.4)

where \( \chi = \mu_2 / \mu_1 \).

For existence of nonzero solutions of (2.3) and (2.4) it is required that their determinants be zero. From this condition we obtain the following dispersion equation:

\[ \frac{\psi_{11}}{\psi_{12}} = \frac{4(1 - \eta_1 \theta_1)(1 - \eta_1)}{(2 - \eta_1)^2 - \xi^2 \eta_1(1 - \eta_1)} \]

(2.5)

\[ \frac{\psi_{11}}{\psi_{22}} \frac{\psi_{12}}{\psi_{22}} = \frac{\psi_{12}}{\psi_{22}} \chi \]

(2.6)

\[ \sqrt{1 - \gamma \eta_2} \sqrt{1 - \theta_2 \eta_2} \tau_2 \chi a_{12} a_{21} a_{22} \]

\[ + (2 - \eta_2)x + \gamma \eta_2 - 2) a_{12} a_{22} + 4(1 - \theta_2 \eta_2) \sqrt{1 - \gamma \eta_2} \sqrt{1 - \eta_2} \sqrt{1 - \gamma \eta_2} \sqrt{1 - \eta_2} (-1 + \chi)^2 a_{12} a_{22} = 0 \]

(2.7)

where \( \xi = k_2 / k_1 \), \( a_{ij} = \psi_{ij} H \), \( i, j = 1, 2 \).
From equation (2.5) the wave propagation velocity \( c \) is determined as a function of wave numbers \( k_1, k_2 \), the plate thickness \( 2H \) and the dimensionless parameter \( \theta_1 \). The dispersion relations (2.6) and (2.7) determine the conditions imposed on the middle layer of plate to make possible the propagation of a harmonic wave with phase velocity \( c \). If the ratio \( H/h \), \( \theta_1, \theta_2 \) and \( \gamma \), as well as the value of the phase velocity \( c (\eta) \) of equation (2.5) \([7]\) are known, then from (2.6) and (2.7) \( \chi \) is found depending on \( kH \). Note that (2.7) is a quadratic equation with respect to \( \chi \). Fig. 1 (from (2.6)) and 2 (from (2.7)) show the dependence \( \chi \) on \( kH \) (0 \( \leq \) \( kH \leq 9 \)) for \( H/h = 2 \), \( \theta_1 = \frac{1}{3} \), \( \theta_2 = \frac{1}{5} \) and \( \gamma = 4 \).

3. Now consider the following particular solution for the first layer

\[
\varphi_1 = B_1 \text{ch} v_{1z} z \cdot \exp(i(k_1 x + k_2 y - ckt), \quad \psi_{11} = C_1 \text{sh} v_{12} z \cdot \exp(i(k_1 x + k_2 y - ckt), \\
\psi_{12} = C_{12} \text{sh} v_{12} z \cdot \exp(i(k_1 x + k_2 y - ckt), \quad \psi_{13} = D_{13} \text{ch} v_{12} z \cdot \exp(i(k_1 x + k_2 y - ckt))
\]

(3.1)

and for the second layer

\[
\varphi_2 = A_2 \text{sh} v_{2z} z \cdot \exp(i(k_1 x + k_2 y - ckt), \quad \psi_{21} = D_{21} \text{ch} v_{22} z \cdot \exp(i(k_1 x + k_2 y - ckt), \\
\psi_{22} = D_{22} \text{ch} v_{22} z \cdot \exp(i(k_1 x + k_2 y - ckt), \quad \psi_{23} = C_{23} \text{sh} v_{22} z \cdot \exp(i(k_1 x + k_2 y - ckt)).
\]

(3.2)

Solution (3.1) for the first layer corresponds to the symmetrical vibration mode, whereas (3.2) for the second layer corresponds to the antisymmetric vibration mode.

Substituting (3.1) and (3.2) in equations (1.6) and using the boundary conditions (1.7) and (1.8) and having in mind that \( \text{div} \psi_1 = 0, \text{div} \psi_2 = 0 \), we get:

\[
((\lambda_1 + 2\mu_1)v_{11}^2 - \lambda_1 k^2) \text{ch} v_{11} H \cdot B_1 - 2ik_1 \mu_1 v_{11} \text{ch} v_{11} H \cdot C_{11} + 2ik_1 \mu_1 v_{11} \text{ch} v_{11} H \cdot C_{12} = 0, \\
2i k_1 v_{11} H \cdot B_1 + ik_2 v_{12} \text{sh} v_{12} H \cdot D_{13} + k_1 k_2 \text{sh} v_{12} H \cdot C_{11} - (k_1^2 + v_{11}^2) \text{sh} v_{12} H \cdot C_{12} = 0, \\
2i k_2 v_{12} H \cdot B_1 - ik_1 v_{12} \text{sh} v_{12} H \cdot D_{13} + i k_2 v_{12} \text{ch} v_{12} H \cdot C_{11} = 0, \\
v_{12} \cdot D_{13} + i k_1 \cdot C_{11} + i k_2 \cdot C_{12} = 0,
\]

(3.3)
2\(k_1v_i \sin h_1h \cdot B + ik_2v_i \sin h_2h \cdot D_3 + k_2v_i \sin h_2h \cdot C_1 - (k_1^2 + v_i^2) \sin h_1h \cdot C_1 = \)

\(= \chi (2k_1v_i \sin h_1h \cdot A + ik_2v_i \sin h_2h \cdot D_2) \sin h_1h \cdot C_1 - (k_1^2 + v_i^2) \sin h_2h \cdot D_2),\)

\(2k_1v_i \sin h_1h \cdot B - ik_2v_i \sin h_2h \cdot D_3 - k_2v_i \sin h_2h \cdot C_1 + (k_1^2 + v_i^2) \sin h_1h \cdot C_1 = \)

\(= \chi (2k_2v_i \sin h_2h \cdot A - ik_2v_i \sin h_2h \cdot C_1 - k_2v_i \sin h_2h \cdot D_2 + (k_1^2 + v_i^2) \sin h_2h \cdot D_2),\)

\((\lambda^2 + 2\mu)v_i^2 + (\kappa^2) \sin h_1h \cdot B - 2k_1\mu v_1v_2 \sin h_1h \cdot C_1 + 2k_1\mu v_1v_2 \sin h_2h \cdot C_1 = \)

\(= (\lambda_2^2 + 2\mu_2)v_2^2 - (\kappa_2^2) \sin h_2h \cdot D_2 + k_2v_2 \sin h_2h \cdot D_2,\)

\(ik_1v_i \sin h_1h \cdot B + ik_2v_i \sin h_1h \cdot D_3 - v_2 \sin h_2h \cdot C_1 + ik_2v_2 \sin h_2h \cdot D_2,\)

\(ik_2v_i \sin h_1h \cdot B - ik_2v_i \sin h_1h \cdot D_3 + v_2 \sin h_2h \cdot C_1 - ik_2v_2 \sin h_2h \cdot D_2,\)

\(v_1 \sin h_1h \cdot B + ik_2v_i \sin h_2h \cdot D_2 + ik_2v_2 \sin h_2h \cdot D_2,\)

\(v_1 \cdot D_3 + ik_1 \cdot C_1 + ik_2 \cdot D_2 = 0, v_2 \cdot C_2 + ik_1 \cdot D_2 + ik_2 \cdot D_2 = 0.\)

For existence of nonzero solutions of (3.3) and (3.4) it is required that their determinants were equal to zero, whence we obtain the following dispersion equation:

\[
\frac{\text{th} v_{11} H}{\text{th} v_{12} H} = \frac{(2 - \eta_1^2) - \xi^2 \eta_1 (1 - \eta_1)}{4(1 - \eta_1 \theta_1)(1 - \eta_1)},
\]

(3.5)

\[
\text{th} v_{12} h \cdot \text{th} v_{22} h = \frac{v_2X}{v_{12}},
\]

(3.6)

\[
\sqrt{1 - \gamma \theta_2 n_2} \sqrt{1 - \eta_2 \gamma n_2} a_1 a_2 a_2 a_2 - \sqrt{1 - \gamma \theta_2 n_2} \sqrt{1 - \eta_2 \gamma n_2} (2 - \eta_2) \chi - 2) a_1 a_2 + \]

\[(2 - \eta_2) \chi - \gamma \eta_2 + 2) a_2 a_2 + 4\sqrt{1 - \gamma \theta_2 n_2} \sqrt{1 - \eta_2 \gamma n_2} \sqrt{1 - \eta_2} \sqrt{1 - \eta_2 (1 + \chi)^2 a_1 a_2 + (3.7)}

\]

As was mentioned above, having the values of phase velocity \(c(\eta_i)\) determined from equation (3.5) and of ratio \(H/H, \theta_1, \theta_2, \) and \(\gamma\) from equations (3.6) and (3.7), one can find \(\chi,\) i.e. the Lame coefficient of the intermediate layer of the plate, in which the propagation of harmonic wave with phase velocity, equal to that with \(c(\eta_i)\) of a single-layer plate was possible.

Note, that when the three-layer plate passes into a single layer, the dispersion relations (2.6), (2.7) and (3.6), (3.7) become identities, and in case of \(\xi = 0\) these relations coincide with the relevant relations given in [6].
