

On Some Peculiarities of Medical Slang

Marianna Ohanyan

Slang is one of the vehicles through which languages change and become renewed and its vigour and colour enrich daily speech. All languages, countries and periods of history have slang. This is true because they all have had words with varying degrees of social acceptance and popularity. All segments of society including the most educated, cultivated speakers and writers, use some slang¹. In fact, this is part of the definition of slang given by Galperin (Гальперин 1956:108). It is well-known that slang fills a necessary niche in all languages, occupying a middle ground between the standard and informal words accepted by the general public and the special words and expressions known only to comparatively small social subgroups. Slang tends to originate in subcultures within a society. Occupational groups (e.g. loggers, police, medical professionals and computer specialists) are prominent originators of both jargon and slang (Partridge 1979). Slang² expressions often embody attitudes and values of group members. They may thus contribute to a sense of group identity and may convey information to the listener about the speaker's background. Although it has gained respectability in the 20th century in the past it was often loudly condemned as vulgar. To understand slang fully, one must remember that a word's use, popularity, and acceptability can change. Words can change in social level, moving in any direction. Language is dynamic, and at any given time hundreds, and perhaps thousands, of words and expressions are in the process of changing from one level to another, of becoming more acceptable or less acceptable, of becoming more popular or less popular. Slang³ is used for many purposes, but generally it expresses a certain emotional attitude; the same term may express diametrically opposed attitudes when used by different people. The processes by which words become slang are the same as those by which other words in the language change their form or meaning or both. In addition to occupational and professional groups, there are many other types of subcultures that supply slang. These include sexual deviants, narcotic addicts, ghetto groups, institutional populations, agricultural subsocieties, political organizations, the armed forces. The professions like medicine, law etc. tend to create true neologisms often based on Greek and Latin roots, but these are not major sources for slang, though nurses and medical staff adapt some medical terminology to their slang.

The central aspect of medical slang is the use of facetious but impressive-sounding acronyms, formed from the first letters of the words that make up the name of something, and invented terminology to describe patients, co-workers or tricky situations. In other words, it serves as a convenient code between medical professionals. Nevertheless, medical slang tends to be restricted to oral use and to informal notes, as it can lead to misunderstanding for the patient

and the relatives. Health and care professionals need good communication skills to develop positive relationships and share information with people using services. Interpersonal skills are also of great importance, the doctor should be able to communicate successfully with the patients and the relatives. Slang sometimes insults or shocks when used directly, some terms euphemize a sensitive concept. Slang is, on the one hand, thought to overcome anxieties encountered within normal medical practice (Coombs et al., 1993). These anxieties may arise as a result of clinical and diagnostic uncertainty, the difficulty in treating fellow human beings, and to distance oneself from disease and death. Gordon (1983), however, does not advocate any of these. He believes that the use of hospital slang merely facilitates interrelations among staff, thereby allowing social grouping and rapport. After all, the terms are not used in front of the patients and, if anything, suggest frustration and anger against a patient group for whom little sympathy is offered. Slang is not used in formal spoken language, or in writing, unless the speaker is attempting to achieve a deliberate effect. Some slang terms, however, make the jump from slang to accepted common usage, as was the case with “OK”.

Medicine is a profession already overflowing with acronyms, technical terms and Greek and Latin borrowings and doctors over the years have intended plenty of their own. In medical practice the use of slang is widely used. It is directed at colleagues rather than patients. Medical slang is the one used by doctors, nurses, paramedics and other hospital and medical staff. One part of medical slang is the use of technical-looking acronyms to describe patients, co-workers or situations, often facetiously, to other medical professionals. Medical slang has a growing vocabulary, yet its use in Britain remains mostly overlooked by main-stream medical literature. The oldest written sources of western medicine are the Hippocratic writings from the 5th and 4th centuries B.C. which cover all aspects of medicine at that time and contain numerous medical terms. [www.ncbi.nlm.nih.gov/pmc/.../PMC114250]. This was the beginning of the Greek era of the language of medicine, which lasted even after the Roman conquest, since the Romans, who had no similar medical tradition imported Greek medicine. There is no recognized discipline called medical linguistics, but perhaps, as many linguists think, there ought to be one. The language of medicine offers intriguing challenges both to medical historians and to linguists (Spears Richard 1982). Medical slang contains lots of acronyms such as AIDS, CT, MR and PCR present the difficulty that usually the initials no longer fit when the English term is translated, but as a rule such discrepancies are simply ignored. AIDS, for instance, is widely accepted and has almost become a noun in its own right, though in French and Spanish it is SIDA and in Russian СПИД, reflect the order of the equivalent words in these languages.

While analyzing medical acronyms we have noticed an important thing that some of them denote a word in English but have quite another meaning: when doctors use *dance* in medical

slang it has nothing to do with the act of moving when hearing music or *vomit* in medical slang means victim of modern imaging technology and has nothing to do with the ejecting from the mouth as the result of involuntary muscular spasms of the stomach and oesophagus. There are some more slang words which have quite a different meaning if compared to their everyday usage.

Dance- the process of trying a surgical gown behind the surgeon's back

Teeth- tried everything else

Cats- cut all to short

Dentist- doesn't even need treatment

Craft- can't remember a damned thing

Vomit- victim of modern imaging technology

Tube- totally unnecessary breast examination

Wall- a doctor who resists admitting patients at all costs

Noctor- nurse that has done a 6 week course and acts like he or she is a doctor

The last one even conveys some humorous effect.

It can be said that medical slang contains lots of death-related acronyms:

Angel lust- a death erection

Fubar- a patient who is so sick or trauma injured that he is beyond help

DOA- dead on arrival

JIC- Jesus is calling

The notion of death is implicit in the above mentioned examples, as the acronyms themselves include no notion of death, it becomes clear without any effort. Another peculiarity of medical slang is that there are colour-related slang word-combinations in which the colour showing component is not bound to show colour at all. They simply make one speech more colourful and expressive.

Code yellow- urination emergency

Blue pipe- vein as opposed to "red pipe" or artery

Code pink- a likely homosexual

Black cloud- a doctor who attracts difficult or prolonged cases or an unusually high number of calls

Blue Blower- patient with severe lung disease

Pink puffer- patient breathing rapidly due to lung disease

Red dot- physicians from India, relates to red dot on their forehead

White lizard- the white coloured "cocktail" given for stomach problems

Black lizard- the coloured "cocktail which contains charcoal

White mice-tampons

The examples above are vivid examples of what has been said. It typically consists of words that are shortened to a brief form, with abbreviations or acronyms, and fancy-sounding words.

Some slang terms are related to occupations for instance:

Pecker-checker- urologist

Baby-catcher- obstetrician

Knuckledragger- orthopedist

Slasher- surgeon

Captain kangaroo- head of the pediatrics department

Humpty-dumpty doctor- a physiatrist or rehabilitation physician

It is obvious that the mentioned slang expressions are somehow connected with a certain aspect of the specialist's job. The job of the obstetrician actually deals with "catching the baby, etc". Such word-combinations are mainly hyphenated, as the research has revealed.

So, it can be said that medical slang being used by doctors, nurses, paramedics and other hospital and medical staff is a kind of a secret language code shared by doctors. During the whole period of medical history the basis for the relations between the doctor and the patient has always been based on the confidence. The success in treatment is possible only through the combination of human confidential relationships and good scientific acquisition. A technically qualified doctor should not only treat the patient but also should have the ability to speak to his patient.

Notes

1. Galperin I.R. states: "Slang is the layer of lexical units and phraseology which occurs in the sphere of colloquial speech in the form of colloquial neologisms which easily transfer into the sphere of generally used colloquial vocabulary.

2. Ernest Weekley, in his "Etymological Dictionary of Modern English" suggests that it may have some relation to the verb "to sling" and cites to two Norwegian dialect words, based upon the cognate verb "slenge" or "slengje" that appear to be its brothers (Weekly 1921:48).

3. Greenough J.B. and Kitteridge C.L. define slang as a peculiar kind of vagabond language, always hanging on the outskirts of legitimate speech but continually straying or forcing its way into the most respectable company.

Բժշկագիտական սլենգի առանձնահատկությունների շուրջ

Սլենգը համընդհանուր լեզվական երևույթ է: Հասարակության բոլոր շերտերն ունեն տվյալ շերտը բնութագրող սլենգ: Բժշկագիտական ոլորտն անմասն չի մնում այս հարցում: Բժշկագիտական սլենգն օգտագործվում է բժշկական անձնակազմի շրջանակներում, որն հասկանալի է միայն տվյալ հանրության համար: Քանի որ բժիշկի և հիվանդի հարաբերության հիմքում ընկած է վստահությունը, հենց այստեղ է, որ սլենգը դրսևորվում է իբրև գաղտնի, կողավորված լեզու բժիշկ-բժիշկ հարաբերություններում, հատկապես այն դեպքերում, երբ հիվանդի ներկայությամբ քննարկումը պետք է ահնասկանալի լինի հիվանդի համար:
